Understanding Patent Documents and Data Fields

Paul Oldham (Ph.D.)

WIPO Open Source Patent Analytics Project

What is a Patent?

- A patent can be described in two main ways:

  1. As a particular form of intellectual property right.

  2. As a type of document.

As a form of intellectual property right

1. A patent is a temporary grant of an exclusive right to a patentee to prevent others from making, using, offering for sale, or importing, a patented invention without their consent, in a country where a patent is in force.

2. Patent rights are territorial rights - they are only valid in the territory of the country where granted.

3. Patents are typically granted for a period of 20 years from the filing data of an application but may be opposed or revoked.

4. To be eligible a claimed invention must: a) Involve patentable subject matter; b) Be new or novel; c) Involve an inventive step; d) Be susceptible to industrial application or useful.

Patents as a type of document

- For patent analytics we need to concentrate on patents as documents and to understand:

  1. The structure of patent documents and their data fields.

  2. The strengths and weaknesses of patent databases as a means for obtaining patent data.

- In this session we deal with the basics of patent documents and their data fields.

Basic Data Types

When performing patent analysis we are dealing with data of seven different types:

1. **Dates** (priority, application and publication dates)

2. **Numbers** (priority number, application number, publication number, family members, citations)

3. **Names** (Applicants - also known as Assignees - and Inventors)

4. **Classification codes** (e.g. International Patent Classification/Cooperative Patent Classification)

5. **Text fields** (Title, Abstract, Description, Claims, Sequence data)

6. **Images** (Diagrams)

7. **Additional Information** (Legal Status, Public Registry etc)

Synthetic genomes: The next step for the synthetic genome

Monya Baker

Nature **473**, 403–408 (19 May 2011) | doi:10.1038/473403a
Published online 18 May 2011

Biologists have copied an existing genetic code, but haven't yet commercialized it or written their own. What will it take for a tour de force to reach industrial force?

Subject terms: Biotechnology · Genetics and genomics

Introduction

Introduction · References · Author information · Related links

A year ago this week, headlines trumpeted that humans had created artificial life. Scientists at the J. Craig Venter Institute in Rockville, Maryland, had chemically synthesized DNA and placed it inside a bacterial cell emptied of its own genetic material. Tests a few days after the insertion showed that the 1-million-base-pair-long synthetic genome was able to run the cellular machinery[1].

Whole-genome engineering could one day create cells unbound by biochemistry as we know it, says George Church, a geneticist at Harvard Medical School in Boston, Massachusetts. Researchers might even be able to design a new genetic code, one that could incorporate more than the 20 or so amino acids used by natural living systems. That achievement is "going to be more than an increment", says Church, "that's going to be a game-changer". But current reality is more prosaic. As

Abstract of WO2008024129 (A2)

Translate this text into Albanian patenttranslate powered by EPO and Google

Methods are provided for constructing a synthetic genome, comprising generating and assembling nucleic acid cassettes comprising portions of the genome, wherein at least one of the nucleic acid cassettes is constructed from nucleic acid components that have been chemically synthesized, or from copies of the chemically synthesized nucleic acid components. In one embodiment, the entire synthetic genome is constructed from nucleic acid components that have been chemically synthesized, or from copies of the chemically synthesized nucleic acid components. Rational methods may be used to design the synthetic genome (e.g., to establish a minimal genome and/or to optimize the function of genes within a genome, such as by mutating or rearranging the order of the genes).; Synthetic genomes of the invention may be introduced into vesicles (e.g., bacterial cells from which part or all of the resident genome has been removed, or synthetic vesicles) to generate synthetic cells. Synthetic genomes or synthetic cells may be used for a variety of purposes, including the generation of synthetic fuels, such as hydrogen or ethanol.

SYNTHETIC GENOMES

Description of WO2008024129 (A2)

A high quality text as facsimile in your desired language may be available amongst the following family members:

SYNTHETIC GENOMES

By J. Craig Venter, Hamilton O. Smith and Clyde A. Hutchison III

CROSS-REFERENCE TO RELATED APPLICATIONS

[001] The present application claims benefit and priority from U.S. Provisional Patent Application Serial No. 60/742,542 filed on Dec. 6, 2005, entitled, "Synthetic Genomes;" the present application is related to U.S. Provisional Patent Application Serial No. 60/752,965 filed on Dec. 23, 2005, entitled, "Introduction of Genomes into Microorganisms;" U.S. Provisional Patent Application Serial No. 60/741,469 filed on Dec. 2, 2005, entitled, "Error Correction Method;" and U.S. Non-Provisional Patent Application Serial No. 11/502,746 filed on Aug. 11, 2006, entitled "In Vitro Recombination Method," all of which are incorporated herein by reference.

STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT

[002] This invention was made with U.S. government support (DOE grant number DE-FG02-02ER63453). The government has certain rights in the invention.

Original claims | **Claims tree**

CLAIMS What is claimed is:

1. A method for constructing a synthetic genome comprising: assembling nucleic acid cassettes that comprise portions of the synthetic genome, wherein at least one of the nucleic acid cassettes is constructed from nucleic acid components that have been chemically synthesized, or from copies of chemically synthesized nucleic acid components.

2. The method of claim 1, wherein one or more of the nucleic acid cassettes are prepared by assembling chemically synthesized, overlapping oligonucleotides of about 50 nucleotides.

3. The method of claim 1, wherein the cassettes are about 4 kilobases to about 7 kilobases in length.

4. The method of claim 1, wherein the cassettes are about 4.5 kilobases to about 6.5 kilobases in length.

Round Up

In this session we have walked through some of the most important patent data fields.

These fields are the building blocks for sophisticated patent analysis. In future sessions we will focus on:

- Retrieving data with these fields
- Cleaning up the data in these fields
- Mapping trends
- Network Mapping
- Geographic Mapping
